

**ABSTRACT:**

An intraocular lens with an optical lens part, which has a central lens area [2] and at least one further annular lens area [3] surrounding [said] the central lens area, the central lens area [2] and the at least one annular lens area [3] forming at least one common focus and the annular lens area [3] having concentric annular zones, in which the difference in pathlength between adjacent zones is an integral multiple of n=2 or more of the design wavelength.
